With an expanded focus on critical thinking and problem solving, the new edition of Introductory Chemistry: Concepts and Critical Thinking prepares readers for success in introductory chemistry. Unlike other introductory chemistry texts, all materials—the textbook, student solutions manual, laboratory manual, instructor's manual and test item file—are written by the author and tightly integrated to work together most effectively. Math and problem solving are covered early in the text; Corwin builds reader confidence and ability through innovative pedagogy and technology formulated to meet the needs of today's learners.

This book is unique in its utilization of the natural sciences to explain and illustrate key concepts of communist philosophy. In its recapitulation of the spirit of Engels's unfinished manuscript, *The Dialectics of Nature*, it relies on the physical sciences developed since Engels's time to reaffirm the validity of materialist dialectics, a point which is more easily made in the context of natural phenomena than it is in social phenomena. The basic philosophical tenets underlying Communist ideology are all supported by the natural sciences. The book is situated within the Marxist-Leninist-Maoist tradition. Its overarching theme is the need to reclaim our most fundamental weapon of that tradition—it's methodology or philosophy—which has been viliated or even scrapped by well-intentioned revolutionaries throughout the 20th century. In particular, some of Mao's philosophical formulations are found to be erroneous and in opposition to his practice. With the rapidly accelerating deterioration of the global capitalist order in progress since 2007, the urgency of this reclamation cannot be over-emphasized.

In this revolutionary book, a renowned computer scientist explains the importance of teaching children the basics of computing and how it can prepare them to succeed in the ever-evolving tech world. Computers have completely changed the way we teach children. We have Mindstorms to thank for that. In this book, pioneering computer scientist Seymour Papert uses the invention of LOGO, the first child-friendly programming language, to make the case for the value of teaching children with computers. Papert argues that children are more than capable of mastering computers, and that teaching computational processes like de-bugging in the classroom can change the way we learn everything else. He also shows that schools saturated with technology can actually improve socialization and interaction among students and between students and teachers. Technology changes every day, but the basic ways that computers can help us learn remain. For thousands of teachers and parents who have sought creative ways to help children learn with computers, Mindstorms is their bible.
